ğ
No.9064. The N-terminus of this protease is given in AAB03085. The novel protease has trypsin-like activity, specifically cleaving peptide chains on the carboxyl side of a basic amino acid (e.g., arginine or lysine). It has a pH optimum of 7-8, and is stable between pH 5 and pH10. It has a temperature optimum of approximately 40 degrees Celsius, and is stable between 40 and 50 degrees Celsius. The invention also relates to a method for the preparation of he novel serion protease, and the use of the protease in protein degrees Celsius. The enzyme has coagulant, hypertensive and anti-inflammatory effects. It may also be used in the preparation of leather, for raw silk treatment and for the preparation of protein hydrolysate. Sequences AAB03086-B03089 represent the N-terminal 20 amino acids of trypsin from a variety of organisms.

Fish serine proteinase, useful as a cosmetic, medicament for treating eczema, psoriasis, arthritis, and in the manufacture of the medicament for treating, preventing pathogenic diseases involving receptor mediated binding

Disclosure, Page 5; 38pp, English.

The specification describes a fish serine proteinase. The proteinases are useful as medicaments, for treating and preventing a disease in a human or an animal such as pain, acute inflammation, chronic inflammation, arthritis, inflamed joints, bursatis, osteoarthritis, theunatoid arthritis, juvenile rheumatoid arthritis, juvenile rheumatoid arthritis, systemic lupus erthematosus, phlebitis, tendinitis, rash, psoriasis, acue, eczema, facial seborrheic eczema, eczema of the hands,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           information for amino acid sequence of protein with at least I biological function with added a score on importance of expression of the biological information for each amino acid residue. The database is useful for determination for unknown biological function of a protein or polypeptide based on the homology of amino acid sequence, e.g. steric structure of protein, and includes retrieval and evaluation of high homologous relationship for the determination of mostly resembling protein. The database allows for correct and rapid retrieval and presumption of protein and polypeptide having biological functions.
face or neck, foreskin infections, athlete's foot, fistulae infections, infected topical ulcers, navel infections in newborns, wrinkles, scars, kelloids, boils, wartes and allergic itch, hemorrhoids, wounds, wounds infections, wounds from burns, fungal infections and immunological and autoimmune diseases. They are also useful for removing dead or peeling skin from otherwise healthy skin, and for treating or preventing a disease in which pathogenesis is caused by bacteria, virus, fungus, parasite or a protozoan or a receptor mediated binding is involved. The present sequence represents the amino terminal of bovine trypsins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    protein function; trypsin; bovine; homology; resemblance.

                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents the TRYP protein.

The invention relates to a database containing information on the amino acid (as) sequences of proteins of which I or more biological functions are known. The database also contains additional information on the score of importance of each as residue in the whole as sequence in determining the known biological functions. The invention also relates to a method of preparing an alignment between as sequences contained in the database and those of the unknown polypeptide. This is represented as the homology amongst various sites, each being identified as having a high score of importance in determining potential biological functions. The method is used to enable an efficient estimation of the biological functions used to enable an efficient estimation of the biological functions their as equences. Suitable proteins can then be isolated and purified by various means. This could be of considerable use in a biological and medical context. The computerised procedure is efficient, fast and

The invention relates to a transgenic plant that comprises DNA encoding an active or inactive form of a heterologous protease (e.g., trypsin) The nuclectide sequence encoding the protease is operably linked to a promoter to effect expression of the protease in the plant. The transgenic plant is used in a method of producing protease in commercial quantities, comprising the extraction of the protease in commercial blomass. The current source of trypsin is the organs of animals. One of the main difficulties with this source is that there is considerable contamination by other proteases. Chymotrypsin is one of the additional overcomes the product in an undesired manner. The method of the invention overcomes the problem of contamination by other additional proteases. By directing the expression of the protease and contamination by contamination by contamination overcomes the problem of expression of the protease and having it digest the proteins in the plant, resulting in cell death is overcome. The proteins in the plant, resulting in cell death is overcome. The proteins in the plant, resulting in cell death is construction of a plant expression plasmid in the exemplifications of the invention.
                                                                                                                              encoding a heterologous protein, used
                                                                                                                    Transgenic plant containing DNA encoding a for the commercial production of protease
                                                                                                                                                                                            Example 1; Page 28-29; 32pp; English

Expression vectors for bovine trypsin and bovine trypsinogen for cleavage of zymogens into active drugs, e.g. pro-insulin conversion into insulin

```
produced by cleavage of a trypsinogen analogue (AAY91925). A wild type bovine trypsinogen was mutated to destroy the trypsin cleavage site. The lys residue present in the leader sequence of the native bovine trypsinogen was mutated to an Asp residue. The vector was constructed such that DNA encoding a (Glu-Ala)2 peptide was inserted between the C-terminus of the alpha factor signal and the N-terminus of the trypsinogen analogue leader sequence to improve the yield of the secreted protein. The specification claims an isolated trypsinogen analogue leader the secreted protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New trypsinogen analog useful for the production of recombinant trypsin has a modified leader sequence not cleavable by trypsin or trypsin-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pain ia

  sequence having at least two amino acids which are not Lys or Arg.
The trypsin derived from the recombinant trypsinogen is useful for the characterization of other proteins, and in the manufacture of other recombinant bioproducts, for example to cleave leader sequences from small recombinant proteins expressed initially as fusion proteins. The present method provides for expression of an inactive zymogen form that is soluble and properly folded yet is not activated until after purification from fermentation broth or cell extracts. This is accomplished through the expression of a single chain trypsinogen analogue where the leader sequence is modified such that it lacks a rangous of the present invention lack a lysin or arginine in the netwant leader sequence of the protein to prevent auto-activation or activation by endougenous host cell enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is bovine met-phe-trypsinogen. Trypsin is a serine protease which cleaves the peptide bond on the carboxy-terminus of basic amino acid residues. Trypsin is synthesised in a slightly longer catalytically inactive form: trypsinogen, which itself is cleaved (leader sequence removed) to give trypsin. The leader sequence of the present protein consists of ((Asp)4-Lyps) and is present at the amino-terminus. This protein has two additional residues at the amino-terminus. Phe. Bovine met-phe-trypsinogen is useful for the manufacture of recombinant protein pharmaceuticals. High purity trypsin products are

The wild type bovine trypsinogen was mutated to destroy the trypsin cleavage site. The lys residue present in the leader sequence of the native bovine trypsinogen protein was mutated to an Asp residue. The vector was constructed such that DNA encoding a (Glu-Ala)2 peptide was inserted between the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New trypsinogen analog useful for the production of recombinant trypsin
has a modified leader sequence not cleavable by trypsin or trypsin-like

trypsingen analogue leader sequence to improve the yield of the secreted protein. The specification claims an isolated trypsinogen analogue leader sequence to improve the yield of the secreted protein. The specification claims an isolated trypsinogen analogue comprising a protein having trypsin activity and a leader sequence having at least two amino acids which are not lys or Arg. A recombinantly produced trypsin (AAY91926) is also claimed. The trypsin (derived from the recombinant trypsinogen is useful for the claracterization of other proteins, and in the manufacture of other recombinant proteins, and in the manufacture of other recombinant proteins expressed initially as fusion proteins. The present method provides for expression of an inactive zymogen form that is soluble and properly folded yet is not activated until after purification from fermenteation broth or cell extracts. This is a complished through the expression of a single chain trypsinogen analogue where the leader sequence is modified such that it lacks a rippin-like enzyme cleavage site. Specifically the trypsinogen analogues of the present invention lack a lysin or arginine in the Netwinship was a leader sequence of the protein to prevent auto-activation or activation by endougenous host cell enzymes. Analysis of three-dimensional structures by generating combination of correspondence satisfying restriction condition, and calculating root mean square distance between elements in the combination of correspondence.

Disclosure, Fig 38; 65pp; English.

The present invention relates to a method for analysis of three dimensional structures. The method involves generating a combination of correspondence satisfying a restriction condition between the elements belonging to a first and second point sets from among all candidates for

1 IVGGYTCGANTVPYQVSLNS 20

ò

ö ö the combination of correspondence, and calculating a root mean square distance between the elements corresponding in the combination of correspondence. The method is useful for analysing three-diamensional structures of molecules, particularly proteins. To illustrate the invention, the serine proteases trypsin and elastase were used. The present sequence is a partial sequence for trypsin. The histidine and serine active sites of trypsin and elastase were used. The serine active sites of trypsin and elastase were analysed using the method of the invention. An almost complete pig trypsinogen (AAW08475) lacking the very N-terminal end of the signal peptide is the product of a cDNA clone (AAT49878) isolated from a pig pancreas cDNA library. The cDNA clone can be fused to a signal sequence (e.g. from the native enzyme or from a specified amylase gene) and used for prodn. of recombinant trypsin in transformed host cells, esp. filamentous fungus, e.g. Aspergillus oryzae or Aspergillus niger. Levels of trypsin secreted by Aspergillus spp. are several-fold higher than those obtd. using other microbial systems. Gaps Gaps fused to signal with recombinant DNA comprising trypsinogen sequence fused to signarequence, provides higher level of expression than other expression Prodn. of trypsin or trypsinogen in filamentous fungi - transformed ö Trypsinogen; trypsin; protease; filamentous fungus; Asperillus. ö Length 223; 89.7%; Score 96; DB 18; Length 247; 85.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents an immunogenic fragment of the canine anionic trypsinogen amino acid sequence. The fragment corresponds to amino acid residues 24 to 43 of the anionic trypsinogen protein sequence (see AAY78975). The invention relates to monoclonal antibodies with specificity against canine trypsin, or canine trypsin-related substances. The antibodies are highly specific and can be used as reagent for quick and accurate detection and quantitation of canine trypsin and canine trypsin-like immunoreactants in various forms. The antibodies can be used in the diagnosis of diseases such as pancreatitis, pancreatic cancer, renal insufficiency and extrapancreatic hyposecretion.
                                                                                                                                                                                                                                          Canine anionic trypsinogen immunogenic fragment #2 amino acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Anti-canine trypsin monoclonal antibody, useful as reagent for quick and accurate detection and quantitation of trypsin and/or trypsin-like immunoreactants in various forms in diagnosis e.g. of pancreatic

This sequence represents the canine anionic trypsinogen amino acid sequence. The protein was isolated from the canine pancreas. The invention relates to monoclonal antibodies with specificity against canine trypsin, or canine trypsin-related substances. The antibodies are highly specific and can be used as reagent for quick and accurate detection and quantitation of canine trypsin and canine trypsin-like immunoreactants in various forms. The antibodies can be used in the diagnosis of diseases such as panoreatitis, pancreatic cancer, renal insufficiency and extrapancreatic hyposecretion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Anti-canine trypgin monoclonal antibody, useful as reagent for quick and accurate detection and quantitation of trypsin and/or trypsin-like immunoreactants in various forms in diagnosis e.g. of pancreatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

C.Species: Ratius norvegicus (Norway rat)
C.Species: 1-Jul-1992 #sequence_revision 17-Jul-1992 #text_change 22-Jun-1999
C.Accession: JOH27
C.Accession: JOH27
A.File: Identification of CDNAs encoding two novel rat pancreatic serine proteases.
A.Fecrence number: JOH471; MUID:92165057; PMID:1537555
A.Accession: JOH27
A.Focossion: JOH27
A.Molecule type: mRNA
A.Residues: 1-246 «KAN»
A.Fecsidues: 1-246 «KAN»
A.Fesidues: 1-24/Domain: accivation peptide #status predicted «ACT»
F.J5-246/Product: trypsin homology «TRY»

$55066

Lrypain (EC 3.4.21.4) II precursor, pancreatic (clone 2-P29) - chicken
NyAlternate names: trypsinogen II
C;Species: Gallus gallus (chicken)
C;Accession: S55066; $723.47

Biochem. J. 307, 471-479, 1995
